Hi, I'm Denys.
I would like to describe myself as a curious, creative one, furthermore, I'm the kind of person who really likes to experiment. And I love all the aspect of programming because every expect can merge in a wonderful and sinuous way to create whatever your imagination can archive and
even if some of the other students in the academy have called me a hard worker because I was always available to help other person and in the same moment work on my project and Enterprise but I think the best definition for me is "Smart Worker" because every time I experiment something with Xcode I save the result and conserve it in case it will be necessary so I don't waste nothing, every lessons and discovery are never wasted!

In the past 9 months, I've learned so much in such short time that I think it can be called a miraculous to me, I have passed from have never touched swift to have a deep understanding of swift and swiftUI, from have never used an apple kit, to have tried almost all of them and from not be able to speak of myself to be able to create a motivational letter all by myself and maybe this is the thing that I'm the most proud of because it demonstrates not only the growth of my skills but the growth of me as a person.

I love to code because I think that every code is a puzzle that is just waiting to be solved, personally I think that is like a game of chess.
Just like the chess game you can train yourself and improve, with train and experience, after all, it does not matter you want to improve yourself till is something that you love to do and think that is worth your time.

Not only did I develop a proficient understanding of Apple framework after endless tries with frontend end backend element, over the different challenges and difficulties I was able to archive a excellent teamwork with my teams improving my teamwork, with the enterprise challenges I was able to improve my pitching skills and with every challenge that I do my UX understanding growing!
So when I first learned about the Pier Project I could only be truly elated by having the possibilities to pass another year on this wonderful place that is my home now and prove that I can give a lot more, help a lot more and most important of all xCode a lot more!

And I'd like to have the possibility to be one of the lucky few to enter in the Pier Project to have the opportunity to code my ideals, debug my error and print my future!

Best Regards,
